

VAL CoPilot — Consolidated Changes Prompt

Synthetic Contract Intelligence Tool-Layer POC · Agent handoff context

Purpose

This document is a consolidated handoff prompt covering all VAL CoPilot changes delivered in the recent agent workstream. Paste or attach it as system/context for follow-on agents so behavior stays consistent.

Architecture (do not change boundaries)

- **Streamlit** (test_ui/) → **Flask** /api/messages (copilot_agent/) → **LangChain** / **offline router** → **FastMCP tools** (mcp_server/) → LinkSquares synthetic fixtures / Fabric SQL / Azure AI Search
- Shared persona memory: memory/store.py → data/persona_memory.sqlite
- Offline mocks via USE_OFFLINE MOCKS=true / AZURE_OPENAI_FORCE_OFFLINE=true
- Active fixtures: LinSquare_Contracts_100_Updated_30bb.json + agreement_9a06.json (old Test_contracts_0397 / test_fixtures removed)

Product rules already implemented (must preserve)

1. Compare contracts (any IDs + N-way)

- compare_contracts accepts any contract IDs and N-way lists (not only first/second).
- Multi-vendor / supplier expansion supported (supplier_names, expand_supplier_matches, max_contracts).
- Offline router extracts all mentioned IDs/vendors into compare kwargs.

2. Missing compare = hard stop (no default compare)

If any requested supplier or contract ID cannot be resolved:

- **Do not** default to CON-0001 vs CON-0002
- **Do not** emit a comparative table
- **Do not** emit a recommendation
- Return **exactly and only** the message below
 - The contract information requested for the comparison is not available at the moment
- Same hard stop for mixed known/unknown vendors (never collapse into single-supplier catalog expansion).
- Sanitize legacy hallucination: No two resolvable compare sides detected; defaulting comparison to CON-0001 vs CON-0002.
- Compare intents are forced through the deterministic offline router.

3. Missing search / profile

- Unknown vendor search / unknown contract profile → error: contract_not_present with “No such contract is available...”
- Search/profile use that wording; **compare** uses the hard-stop sentence in section 2.

4. Persona memory — save & retrieve previous searches

- Auto-save search-like user queries per persona.
- Streamlit sidebar **Saved searches**: filter, pin (**Save last search**), Re-run, Open chat, Delete, Retrieve in chat.
- Chat recall: “Show my previous searches”, “Retrieve my saved searches”, “previous searches about {topic}”.

- APIs: GET/POST/DELETE /api/memory/searches, GET /api/memory/recall, GET /api/memory/conversations
- Streamlit sets channelData.clientPersistsMemory=true; Flask persists for other clients.
- Memory-recall intents are forced through the offline persona store.

5. Docs / Foundry

- Process-flow architecture PDF/PPTX refreshed for tool-layer POC.
- Foundry framed as optional; deploy_to_foundry.py ToolSet covers the MCP tool surface.

Key merged PRs

PR	Change
#12	Process-flow docs + Foundry deploy refresh
#13	LinkSquares fixtures; remove old Test_contracts / test_fixtures
#14	Any-ID + N-way compare_contracts
#15	No default compare when contracts are missing
#16	Persistent persona conversation / search memory
#17	Missing compare/search/profile messaging + hard-stop refinements
#18	Explicit save / retrieve / pin / filter / delete for previous searches

Runtime

- Flask: http://localhost:3978
- Streamlit: http://localhost:8501
- Branch work uses cursor/<name>-a9d1; preferred PR base: main

When changing behavior next

- Prefer deterministic offline-router / MCP hard stops over relying on the LLM.
- Do not reintroduce default CON-0001/CON-0002 compares.
- Keep Streamlit ↔ Flask memory ownership clear (clientPersistsMemory).
- Preserve existing LinkSquares fixture-backed offline mocks.

One-liner sticky note

VAL CoPilot: N-way any-ID compare; missing supplier/ID compare hard-stops with exactly “The contract information requested for the comparison is not available at the moment” (no table/recommendation/default pair); unknown search/profile → “No such contract is available”; persona SQLite memory auto-saves searches with Streamlit pin/filter/re-run/delete and chat/API recall; LinkSquares fixtures only; Foundry optional.
